

SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE VETERINARY MEDICINAL PRODUCT

Vitamivet K1 10 mg/ml Solution for Injection for Dogs

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each ml of solution contains:

Active substance:

Phytomenadione 10.0 mg

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Solution for injection

Yellow, clear to slightly opalescent liquid.

4. CLINICAL PARTICULARS

4.1 Target species

Dog.

4.2 Indications for use, specifying the target species

Emergency treatment of anticoagulant rodenticide poisoning, before starting oral treatment..

4.3 Contraindications

Do not use in cases of hypersensitivity to the active substance or to any of the excipients.

4.4 Special warnings for each target species

As the anticoagulant effects of rodenticides are known to be long lasting it is recommended to start vitamin K1 supplementation with an oral formulation within 12 hours of the last injection for a duration of 3 weeks, and to evaluate the coagulation status (via one stage prothrombin times) 48 hours after the last administration. In the case of persistence of the anticoagulant in the body, the duration of treatment can be extended as long as the anticoagulant persists, to avoid relapse (the coagulation status has to be evaluated 48 hours after each attempt of treatment cessation).

4.5 Special precautions for use

i) Special precautions for use in animals

Administer by slow intravenous injection.

The formation of prothrombin may be inadequate when dealing with patients with severe liver dysfunction. Therefore requires a careful monitoring of coagulation parameters after administration of vitamin K1

ii) Special precautions to be taken by the person administering the veterinary medicinal product to animals

People with known hypersensitivity to phytomenadione should avoid contact with the veterinary medicinal product.

Avoid contact with eye. In the event of accidental contact with eye, rinse immediately and thoroughly with tap water, then seek a doctor and show the label to the physician.

In case of accidental self-injection, seek medical advice immediately and show the package leaflet or the label to the physician.

Special precautions for the protection of the environment:

Not applicable.

4.6 Adverse reactions (frequency and seriousness)

Dogs:

Undetermined frequency:	Hypersensitivity reactions (anaphylactic-type reactions)
-------------------------	--

Reporting adverse events is important. It allows continuous safety monitoring of a veterinary medicinal product. Reports should be sent, preferably via a veterinarian, to either the marketing authorisation holder or its local representative or the national competent authority via the national reporting system. See also the last section of the package leaflet for contact details.

4.7 Use during pregnancy, lactation or lay

The safety of the veterinary medicinal product has not been established in bitch during pregnancy and lactation.

Pregnancy and lactation

Use only accordingly to the benefit/risk assessment by the responsible veterinarian.

Laboratory studies have shown not produced any evidence of teratogenic or foetotoxic effects. Vitamin K1 crosses the placental barrier.

4.8 Interaction with other medicinal products and other forms of interaction

Salicylates (NSAID) and cephalosporins presenting the N-methyl-thiotetrazole moiety may reduce the effect of vitamin K1, by inhibition of the vitamin K1 recycling.

4.9 Amount(s) to be administered and administration route

Intravenous use

Slow injection of 5 mg vitamin K1 per kg bodyweight (equivalent to 0.5 ml of the veterinary medicinal product per kg bodyweight) prior to commencing oral therapy (see section 4.4). Treatment by injection should be repeated once 12-18 hours later if oral treatment is not immediately possible.

4.10 Overdose (symptoms, emergency procedures, antidotes), if necessary

Vomiting has been observed in the dog after the 1st and the 2nd injections, administered 12 hours apart at 3 times the recommended dose (15 mg of vitamin K1 per kg of body weight per injection).

Repeating dosing (10 days) at 7 times the recommended dose of a degraded solution (degradation of lecithin into lysolecithin is observed with time during the storage of the veterinary medicinal product) caused intravascular haemolysis, involving marked anaemia and vomiting.

4.11 Withdrawal period(s)

Not applicable.

5. PHARMACOLOGICAL PROPERTIES

Pharmacotherapeutic group: antihæmorrhagic

ATC Vet Code: QB02BA01

5.1 Pharmacodynamic properties

Vitamin K1 is a cofactor necessary for the synthesis of K-dependent coagulation factors (factors II, VII, IX and X). During this synthesis, vitamin K1 is converted into vitamin K1 hydroquinone (active form of vitamin K1) and then into vitamin K1 epoxide. It is then recycled back into vitamin K1. Antivitamin K rodenticides inhibit the recycling of vitamin K1 epoxide, causing a risk of uncontrolled bleeding through the absence of functional factors II, VII, IX and X synthesis. The supply of vitamin K1 must be sufficiently large to activate hydrogenase enzyme that converts it to its active (hydroquinone) form.

5.2 Pharmacokinetic particulars

After intravenous administration at 5 mg/kg in the dog, the following pharmacokinetic parameters were obtained:

C_{max} = 85.2 µg/ml, AUC = 4246 µg.min./ml, T_{1/2} = 179.5 min., Cl = 1.15 ml/min., a bioavailability of 100 % and a distribution volume estimated at 4 ×10⁻⁴ ml. One hour after intravenous administration, vitamin K1 is detected in the liver (90% unchanged) before being distributed throughout the body. Some of the vitamin K1 is eliminated with the bile in the intestinal tract after metabolism in the liver, and some is eliminated in urine (in the form of glucuronoconjugated metabolites).

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Glycocholic acid
Lecithin (soya bean)
Sodium hydroxide
Hydrochloric acid
Water for injections

6.2 Major Incompatibilities

In the absence of compatibility studies, this veterinary medicinal product must not be mixed with other veterinary medicinal products.

6.3 Shelf life

Shelf-life of the veterinary medicinal product as packaged for sale: 3 years.
Shelf-life after first opening the immediate packaging: use immediately.

6.4 Special precautions for storage

Store below 25°C. Protect from light.
Any solution remaining in the ampoule following withdrawal of the required dose should be discarded.

6.5 Nature and composition of immediate packaging

5ml amber clear glass ampoules, type I.
Cardboard box of 6 ampoules of 5 ml.

6.6 Special precautions for the disposal of unused veterinary medicinal product or waste materials derived from the use of such products

Any unused veterinary medicinal product or waste materials derived from such veterinary medicinal products should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

Domes Pharma
3 Rue Andre Citroën
63430 Pont-Du-Chateau
France

8. MARKETING AUTHORISATION NUMBER

Vm 54982/5003

9. DATE OF FIRST AUTHORISATION

20 April 2010

10. DATE OF REVISION OF THE TEXT

August 2023

11. CLASSIFICATION OF VETERINARY MEDICINAL PRODUCTS

Veterinary medicinal product subject to prescription.
